MISSOURI BOTANICAL GARDEN
GEORGE ENGELMANN PAPERS

the lobes more or less purple : stamens many. — Rohrbach in Mart. Fl. Bras. xiv$^2$. 310, t. 70.

A very variable species, widely distributed around the globe. It has been collected near Fort Mohave (*Cooper*), and is frequent in saline or alkaline valleys through the interior from N. Nevada to Colorado and New Mexico, often with much broader leaves than is usual in the sea-coast forms.

### 3. MOLLUGO, Linn. Carpet-weed.

Calyx 5-cleft nearly to the base ; the lobes herbaceous, membranously margined. Petals none. Stamens 3 or 5, rarely twice as many, hypogynous. Styles 3. Capsule free, thin-membranaceous, 3 – 5-celled, loculicidally 3 – 5-valved, the partitions breaking away from the persistent central placenta. Seeds several in each cell, longitudinally sulcate on the back. — Annuals, low and much branched, glabrous, not succulent ; leaves linear to obovate-spatulate, entire, opposite and apparently verticillate ; stipules obsolete ; flowers mostly on long pedicels and axillary.

About a dozen species in the warmer regions of the globe. The following is the only one indigenous to N. America.

1. **M. verticillata,** Linn. Prostrate, covering the ground, slender : leaves spatulate to linear-oblanceolate, an inch long or less : pedicels umbellately fascicled at the nodes, slender, 2 or 3 lines long : sepals and oblong-ovoid capsule about 1½ lines long : seeds reniform, shining. — Rohrbach, l. c. 240, t. 55.

On light sandy soils from the Columbia River southward ; at Eagle Creek, near Shasta, and at McCumber's Flat (*Brewer*, *Newberry*) ; from Arizona to Colorado and New Mexico, and frequent in the Atlantic States as a weed in cultivated grounds : thence southward to the W. Indies and Brazil.

Missouri Botanical Garden

It is mainly a tropical and subtropical family, of the Old World. Our Pacific Coast has only two indigenous representatives, both insignificant, and as many naturalized ones, which appear as if wild on the sea-shore.

* Calyx-tube adnate to the ovary : petals and stamens very numerous.

1. **Mesembryanthemum.** Capsule 5-valved or more. Very fleshy.

* * Ovary free : petals none : stamens few or many.

2. **Sesuvium.** Calyx-lobes 5, petaloid. Stamens 5 to 60. Capsule circumscissile. Succulent.
3. **Mollugo.** Sepals 5. Stamens 3 or 5. Capsule 3-valved. Not succulent.

### 1. MESEMBRYANTHEMUM, Linn. ICE-PLANT. FIG-MARYGOLD.

Calyx-tube adnate to the ovary; the lobes usually 5, unequal, foliaceous. Petals very numerous, linear. Stamens innumerable, with slender filaments, inserted with the petals on the tube of the calyx. Styles 4 to 20, usually 5. Capsule 4 – 20-celled, dehiscing in a star-like manner at the depressed summit. Seeds minute, very numerous. — Fleshy herbs or shrubs, rarely annual; leaves mostly opposite, without stipules; flowers mostly showy, terminal and in the forks of the branches.

A genus of about 300 species, principally S. African, but a few found in the Mediterranean region, Western S. America, and Australia. The Californian species are probably introduced.

1. **M. æquilaterale,** Haworth. Perennial, with stout prostrate or ascending stems and short ascending flowering branches : leaves very fleshy, opposite and clasping, linear, acutely triangular, 1 to 3 inches long, smooth : flowers solitary, red, pedicellate or nearly
